ARTICLE

Human Demographic History Impacts Genetic Risk Prediction across Diverse Populations

Alicia R. Martin,^{1,2,3,4} Christopher R. Gignoux,⁴ Raymond K. Walters,^{1,2,3} Genevieve L. Wojcik,⁴ Benjamin M. Neale,^{1,2,3} Simon Gravel,^{5,6} Mark J. Daly,^{1,2,3} Carlos D. Bustamante,⁴ and Eimear E. Kenny^{7,8,9,10,*}

- Genetic prediction accuracy decays with increasing genetic divergence between discovery and target data
- Polygenic scores differ across populations arbitrarily, but these biases are not meaningful
- Neutral human evolution is sufficient to explain differences

How do we integrate genomic risk to improve health and wellness?

- How to transform genetic research into medical knowledge? What are the biases in our current knowledge bases?

Mount Sinai Creates New Genomics Center as Part of \$100M AI Initiative

NEW YORK (GenomeWeb) – The Icahn School of Medicine at Mount Sinai has created the Center for Genomic Health, a new clinical research entity that will be a part of a \$100 million pledge to integrate artificial intelligence into healthcare.

The Center for Genomic Health will be housed in another new and larger center, the Hamilton and Amabel James Center for Artificial Intelligence and Human Health, launched earlier this week. As reported by [Bloomberg](#), the James Center was enabled by an undisclosed philanthropic gift and other funding totaling \$100 million.

- Once we have identified genes that are clinically relevant, how do we systematically identify individuals, communities and/or populations at risk? Understand other factors at play over a patient's life course?
- How do we integrate genomics broadly in health systems for improved health care management?

Population Architecture Using Genomics and Epidemiology

Genetic diversity improves our understanding of complex traits

- **Goal:** Investigate ancestrally diverse populations to gain a better understanding of how genetic factors influence susceptibility to disease.
- **Focus on US minority populations.**

Researchers have access to new data on thousands of exomes. Here's what we found.

3. *TYRP1* variants and Blonde Hair

One of our novel findings is the association of *TYRP1* variants with blonde hair color in those of British ancestry. *TYRP1* made a big splash in 2012 when researchers found that a variant in this gene caused blonde hair in dark-skinned individuals of Melanesian ancestry from the Solomon Islands. This genetic variation is separate from the ones that are known to cause blonde hair in those of European ancestry and, until now, there has been no evidence that this gene also played a role in European hair coloring. The specific variant that causes blonde hair in Solomon Islanders, rs387907171, an arginine to cysteine substitution at amino acid position 93, was only found in 3 of the 40,648 individuals analyzed in our UK Biobank study. However, more than 30 other rare coding variants in this gene were found in 1% of the 4,671 British ancestry blonde individuals. Previous studies have shown that the Solomon Island variant is recessive,

Challenges and opportunities

- Genomics is yielding an enormous engine of knowledge with the potential to transform medicine and society as we know it today
- Genomics tells us about our susceptibility to disorders and diseases – but our DNA can also reveal the broader story of our evolution, ancestry and history that can be also correlated to social, environmental determinants of human phenotypes.
- Challenge and opportunity is to integrate this information in the fuller clinical and social picture of health and wellness
